

Because the binary does not natively handle the Windows service control interface, a wrapper such as NSSM must be used. NSSM may be downloaded from <https://nssm.cc/ci/nssm-2.24-101-g897c7ad.zip> and the nssm.exe binary can be extracted and moved within the system PATH or a preferred location.

This is for Windows Exporter

```
C:\> .\nssm.exe install windows_exporter c:\windows_exporter\exporter.exe  
--collectors.enabled "cs,os,cpu,logical_disk,net,system"  
C:\> .\nssm.exe start windows_exporter
```

This is for Prometheus

```
C:\> .\nssm.exe install prometheus c:\prometheus\prometheus.exe  
--enable-feature=agent  
  
C:\> .\nssm.exe start prometheus
```
